

Reason for visit

Twelve-week nutrition block. Ongoing hypothyroidism, managed.

Subjective

Reports afternoon fatigue 4-5 days per week, worse on days following under six hours of sleep. Appetite stable. No cold intolerance reported this cycle. Training four sessions per week, mixed resistance and zone 2.

Assessment

TSH remains above range at 4.82 with positive TPO antibodies, consistent with autoimmune thyroiditis. Ferritin at the low end and vitamin D frankly low; both plausibly contribute to the fatigue independent of thyroid status.

Plan

1. Repeat TSH, Free T4 and ferritin in eight weeks.
2. Vitamin D supplementation, review at repeat panel.
3. Protein target 1.6 g/kg. Iron-rich foods with vitamin C.
4. Sleep: consistent wake time; flag if sub-6h nights exceed two per week.

Review: eight weeks, or sooner if symptoms change.
